

API DOCUMENT FOR C2B

This API document describes in details how you can do a C2B request with AFRIPAY.

1. Currency List

This endpoint is used to fetch all currencies we use on AFRIPAY.

- URL: <https://www.api.afripay.africa/?request=currency&action=list>

2. Payment Method List

This endpoint is for fetching all payment methods supporting the currency you want to use.

https://www.api.afripay.africa/?request=payment_currencies&action=list_by_currency¤cy=BIF

On the currency param you can put the currency_slug you got on the currency list endpoint.

This endpoint gives you other information on the payment method, such as transaction fees, steps to follow once the payment initiation is successful or if the payment method needs an otp before sending the payment request.

3. Create C2B Request

This function is used to create a request

- API URL : <https://www.api.afripay.africa>
- Method : POST
- Protocol : HTTP
- Format : Form-data

4. Parameters

Parameter	Required	Type	Description
request	x	string	Request type. It will always contain payment as value
payment_type	X	string	Payment type. It will always contain 3 as value
app_id	X	string	Your App ID
app_secret	x	string	Your App secret
payment_method	x	string	Payment method

amount	x	integer	
currency	x	string	
initiator	x	string	Phone number or xxxxxxxxxxxxxx (12 x) if it is a credit/debit card
otp		string	OTP
client_token		string	A reference of your order or invoice,...
comment		String	
return_url		String	

5. Response

The response will always be in JSON format. The response has three keys (status, message, transaction_ref).

If the status value is **success** then the transaction has been initiated and the client needs to confirm through his mobile money account. For credit/debit cards there will be another key (url), you will use it to redirect your client to that page to finalise the payment process.

If the status value is **error**, then the transaction has failed and you can know the reason for the error by getting the value of the message key.

Transaction_ref is the transaction reference which you can use for checking status.

6. OTP request

There are some payment methods (eg. LUMICASH) that need an OTP to initiate a payment request.

This function is used to get the OTP

- API URL : <https://www.api.afripay.africa>
- Method : POST
- Protocol : HTTP
- Format : Form-data

Parameters

Parameter	Required	Type	Description
request	x	string	Request type. It will always contain transaction as value

action	x	string	Action will be getOTP
mobile	X	string	Your phone number
payment_method	x	string	Payment method

7. Check status

This function is used to get the transaction details

- API URL : <https://www.api.afripay.africa>
- Method : POST
- Protocol : HTTP
- Format : Form-data

Parameters

Parameter	Required	Type	Description
request	x	string	Request type. It will always contain transaction as value
action	x	string	Action will be checkstatus
transaction_ref	X	string	Your transaction reference

8. Callback URL

You may share a callbackURL so that AFRIPAY could send on it the payment notification.

Here are the data we send in the notification request.

- Method: POST
- Protocol: HTTP
- Format: Form-data

Data

Parameter	Type	Description
status	string	If status is success it means the transaction is completed otherwise the transaction has failed or still in pending status

transaction_ref	string	Transaction reference
amount	double	
currency	string	
payment_method	string	
client_token	string
