

API DOCUMENT FOR DISBURSEMENT

This API document describes in detail how you can do disbursement with AFRIPAY.

1. Currency List

This endpoint is used to fetch all currencies we use on AFRIPAY.

- URL: <https://www.api.afripay.africa/?request=currency&action=list>

2. Payment Method List

This endpoint is for fetching all payment methods supporting the currency you want to use.

https://www.api.afripay.africa/?request=payment_currencies&action=list_by_currency¤cy=BIF

On the currency param you can put the currency_slug you got on the currency list endpoint.

This endpoint gives you other information on the payment method, such as transaction fees, steps to follow once the payment initiation is successful or if the payment method needs an otp before sending the payment request.

P.S: You will use only the payment method which has enable_on_withdrawal equal to 1.

3. Create Disbursement Request

This function is used to create a request

- API : <https://www.api.afripay.africa>
- Method : POST
- Protocol : HTTP
- Format : Form-data

Parameters

Parameter	Required	Type	Description
request	x	string	Request type. It will always contain payment as value
payment_type	X	string	Payment type. It will always contain 6 as value
app_id	X	string	Your App ID
app_secret	x	string	Your App secret
access_token	x	string	Your access token

payment_method	x	string	Payment method
amount	x	integer	
currency	x	string	
recipient	x	string	Phone number
comment		string	

Response

The response will always be in JSON format. The response has two keys (status and message).

If the status value is **success** then the transaction is successfull completed.

If the status value is **error** then the transaction has failed and you can know the reason of the error by getting the message value.

4. Check status

This function is used to get the transaction details

- API URL : <https://www.api.afripay.africa>
- Method : POST
- Protocol : HTTP
- Format : Form-data

Parameters

Parameter	Required	Type	Description
request	x	string	Request type. It will always contain transaction as value
action	x	string	Action will be checkstatus
transaction_ref	X	string	Your transaction reference
